Seasonal forecast over the Arctic, JJA 2021

A reminder

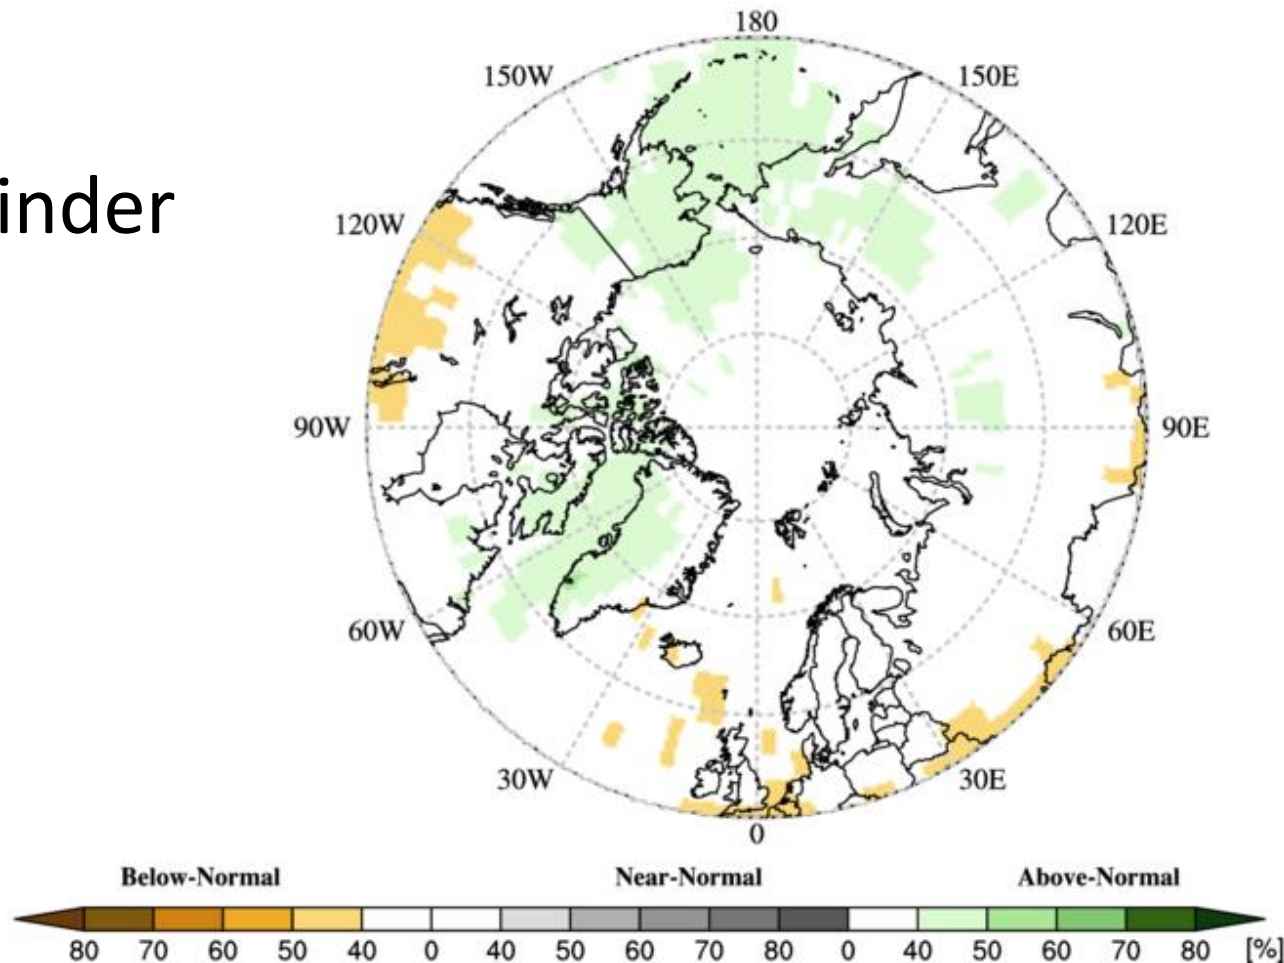

Considering multi-model ensemble forecast and a limited model skill over the Arctic:

Temperature: there is probability of 40% or more that temperatures will be above normal over most of the Arctic regions. The highest probabilities for this forecast were expected over Eastern Siberian region, southern Chukchi and Bering and southwestern portions of Alaska and western Canada region.

Seasonal forecast over the Arctic, JJA 2021

A reminder

Considering multi-model ensemble forecast and a limited model skill over the Arctic:

Precipitation: Mostly above normal precipitation were expected over western Siberian, Chukchi and Berind and Alaska western Canada regions. Over other Arctic region, equal probability chances were expected.

How do we verify seasonal forecasts?

- We need observations!

- Unfortunately we can not measure temperature or precipitation on every single point over the globe.
- This is why we use statistical techniques to interpolate measured variables over the regions where we can measure. The results is called **the re-analysis**.

2) station observations Precipitation

modeling

Precipitation Re-Analysis

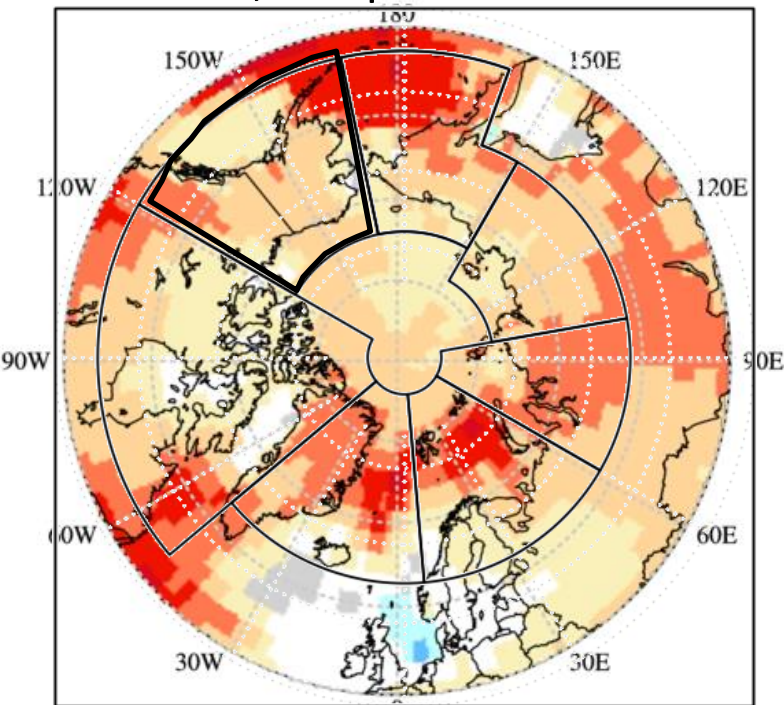

How do we verify seasonal forecasts?

- ❑ We need some metric, some number to quantify the verification result
- ❑ We call this metric a score
- ❑ For the verification over the Arctic we will use a subjective score: a percentage of the correct forecast over a selected region in the Arctic.

C. - E. Canada	Above normal in the west	Below and near normal over the continental parts.	50% where forecast
W. Nordic	Mostly equal chances	Below over Island, above over the central Greenland	%
E. Nordic	Mostly equal chances	Near and above normal in Scandinavia, below and near normal in the eastern parts	%
W. Siberia	Mostly equal chances, above normal in south east	Near normal and below normal over the continental southern parts	%
E. Siberia	Above normal in the east	Mostly below normal	miss
ChukchiBering	Above normal	Mostly below normal	miss

Overall result, subjective verification

- ❑ **Temperature:** Considering all Arctic regions the subjective score is ~50 %. This is a good score considering that everything below or equal 33% is considered worse than a pure chance.
- ❑ **Precipitation:** In the regions where the models were decisive, the forecast did not perform well. Given the historical skill scores we know that precipitation forecasts are usually not very skilful over the Arctic.

Actual (real time)seasonal forecasts over the Arctic NDJ 2021/22

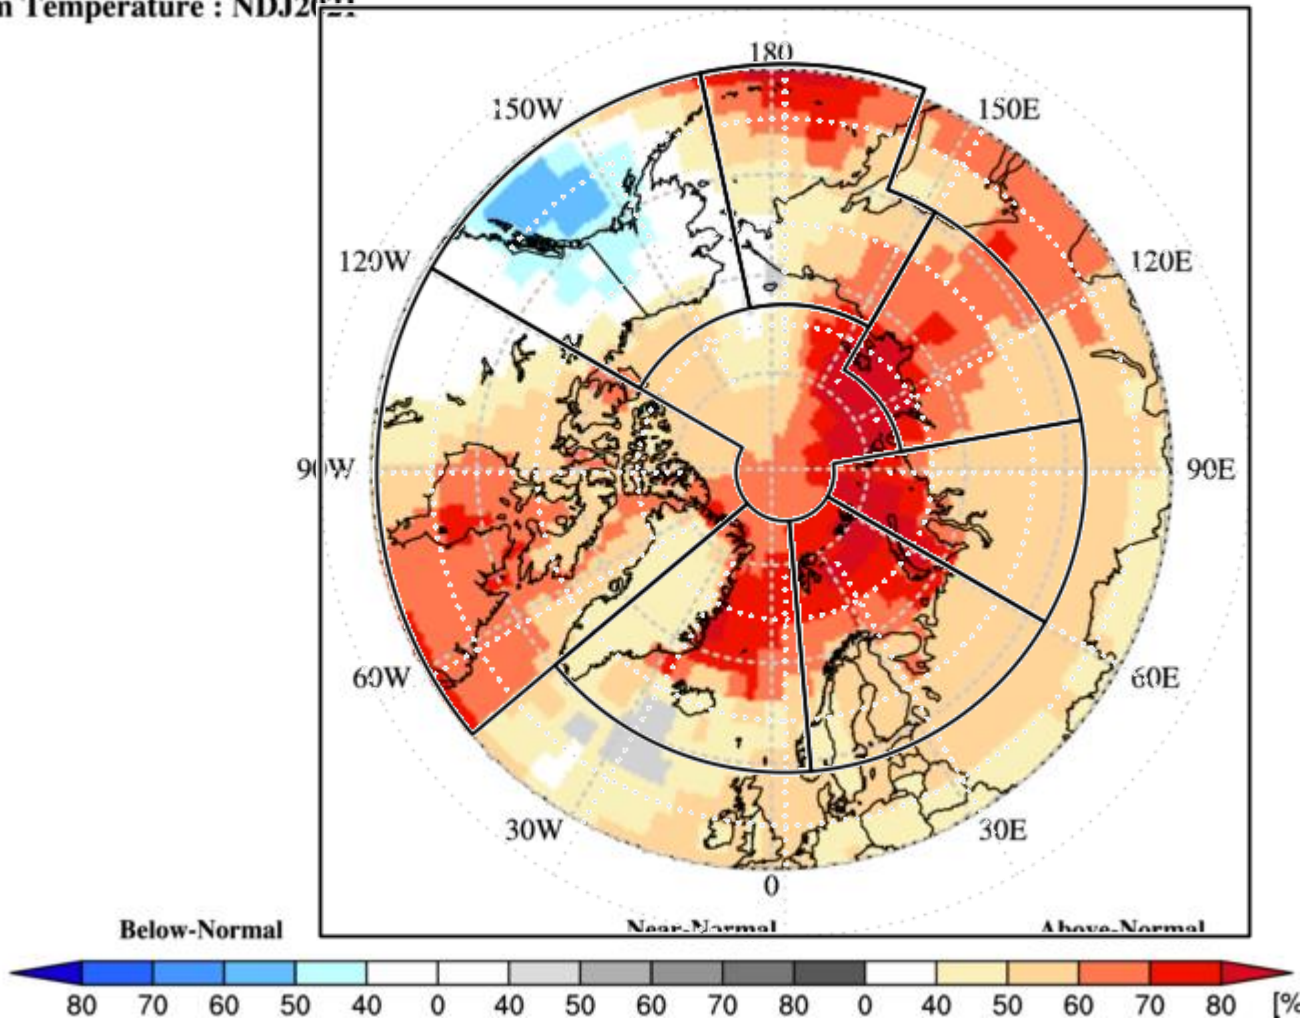

- Temperature
- Precipitation
- Sea Surface Temperature
- Snow Water Equivalent

Temperature outlook over the Arctic: November-December-January 2021/22

Probabilistic Multi-Model Ensemble Forecast

Beijing, CMCC, CPTEC, ECMWF, Exeter, Melbourne, Montreal, Moscow, Offenbach, Seoul, Tokyo, Toulouse, Washington

2m Temperature : NDJ2021

1. Alaska W. Canada
2. Eastern Canadian Arctic
3. Western Nordic
4. Eastern Nordic
5. West Siberia
6. East Siberia
7. Chukchi and Bering

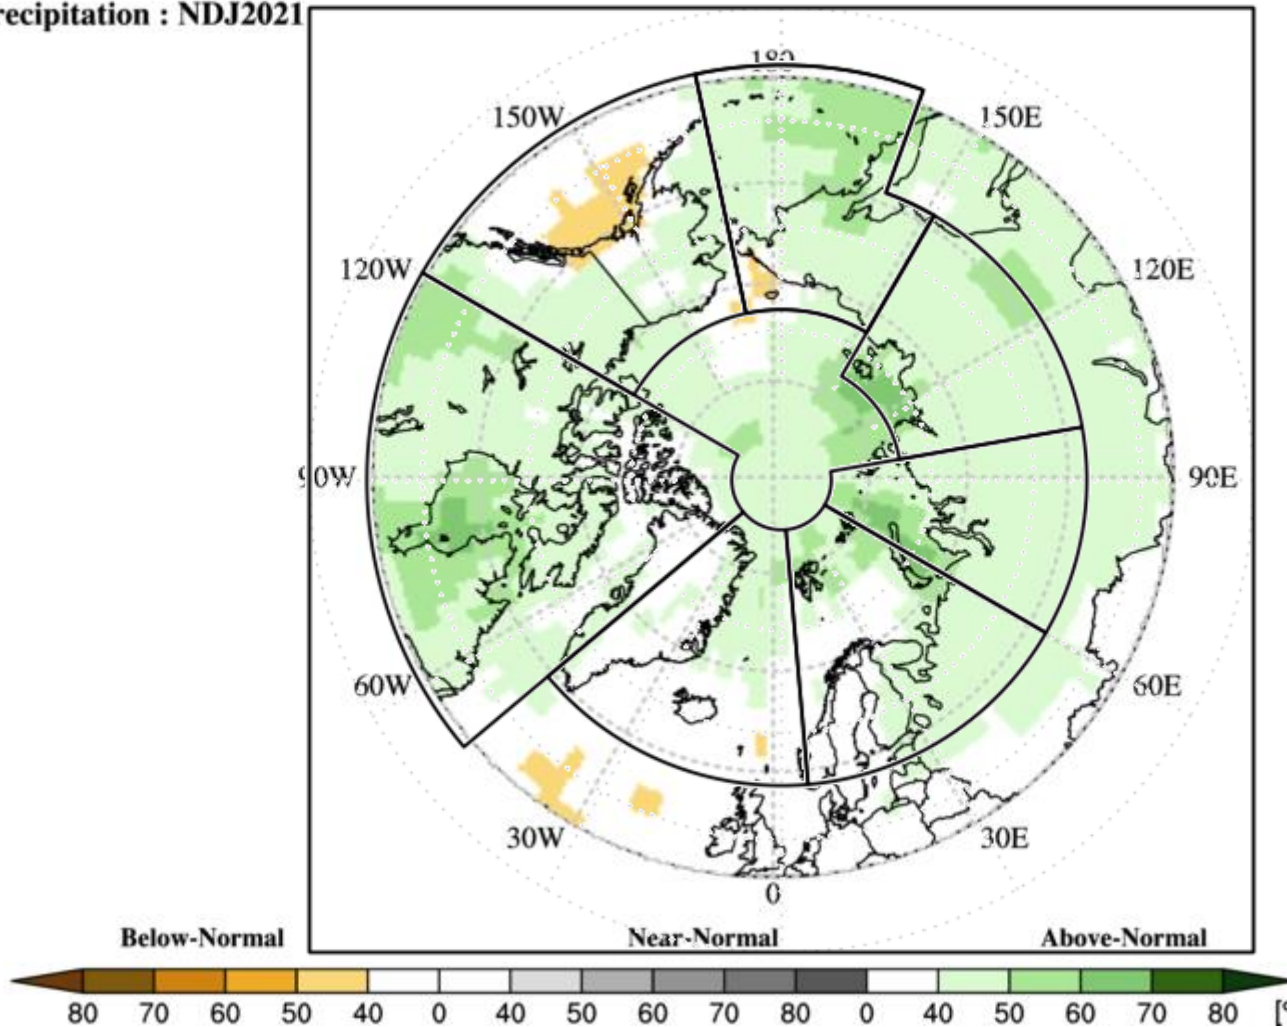

- The redder the color does not mean it is warmer.
- It means we have more confidence in the above normal forecast over that region.

Precipitation outlook over the Arctic: November-December-January 2021/22

Probabilistic Multi-Model Ensemble Forecast

Beijing,CMCC,CPTEC,ECMWF,Exeter,Melbourne,Montreal,Moscow,Offenbach,Seoul,Tokyo,Toulouse,Washington

Precipitation : NDJ2021

1. Alaska W. Canada
 2. Eastern Canadian Arctic
 3. Western Nordic
 4. Eastern Nordic
 5. West Siberia
 6. East Siberia
 7. Chukchi and Bering
- The greener the color does not mean it will precipitate more.
 - It means we have more confidence in the above normal precipitation forecast over that region.

Sea Surface Temperature outlook over the Arctic: November-December-January 2021/22

<https://nsidc.org/arcticseaicenews/map-of-the-arctic-ocean/>

Snow Water Equivalent outlook over the Arctic: November-December-January 2021/22

Experimental product

Calibrated CanSIPS lead 1 forecast: SWE NDJ2021

1. Alaska W. Canada
2. Eastern Canadian Arctic
3. Western Nordic
4. Eastern Nordic
5. West Siberia
6. East Siberia
7. Chukchi and Bering

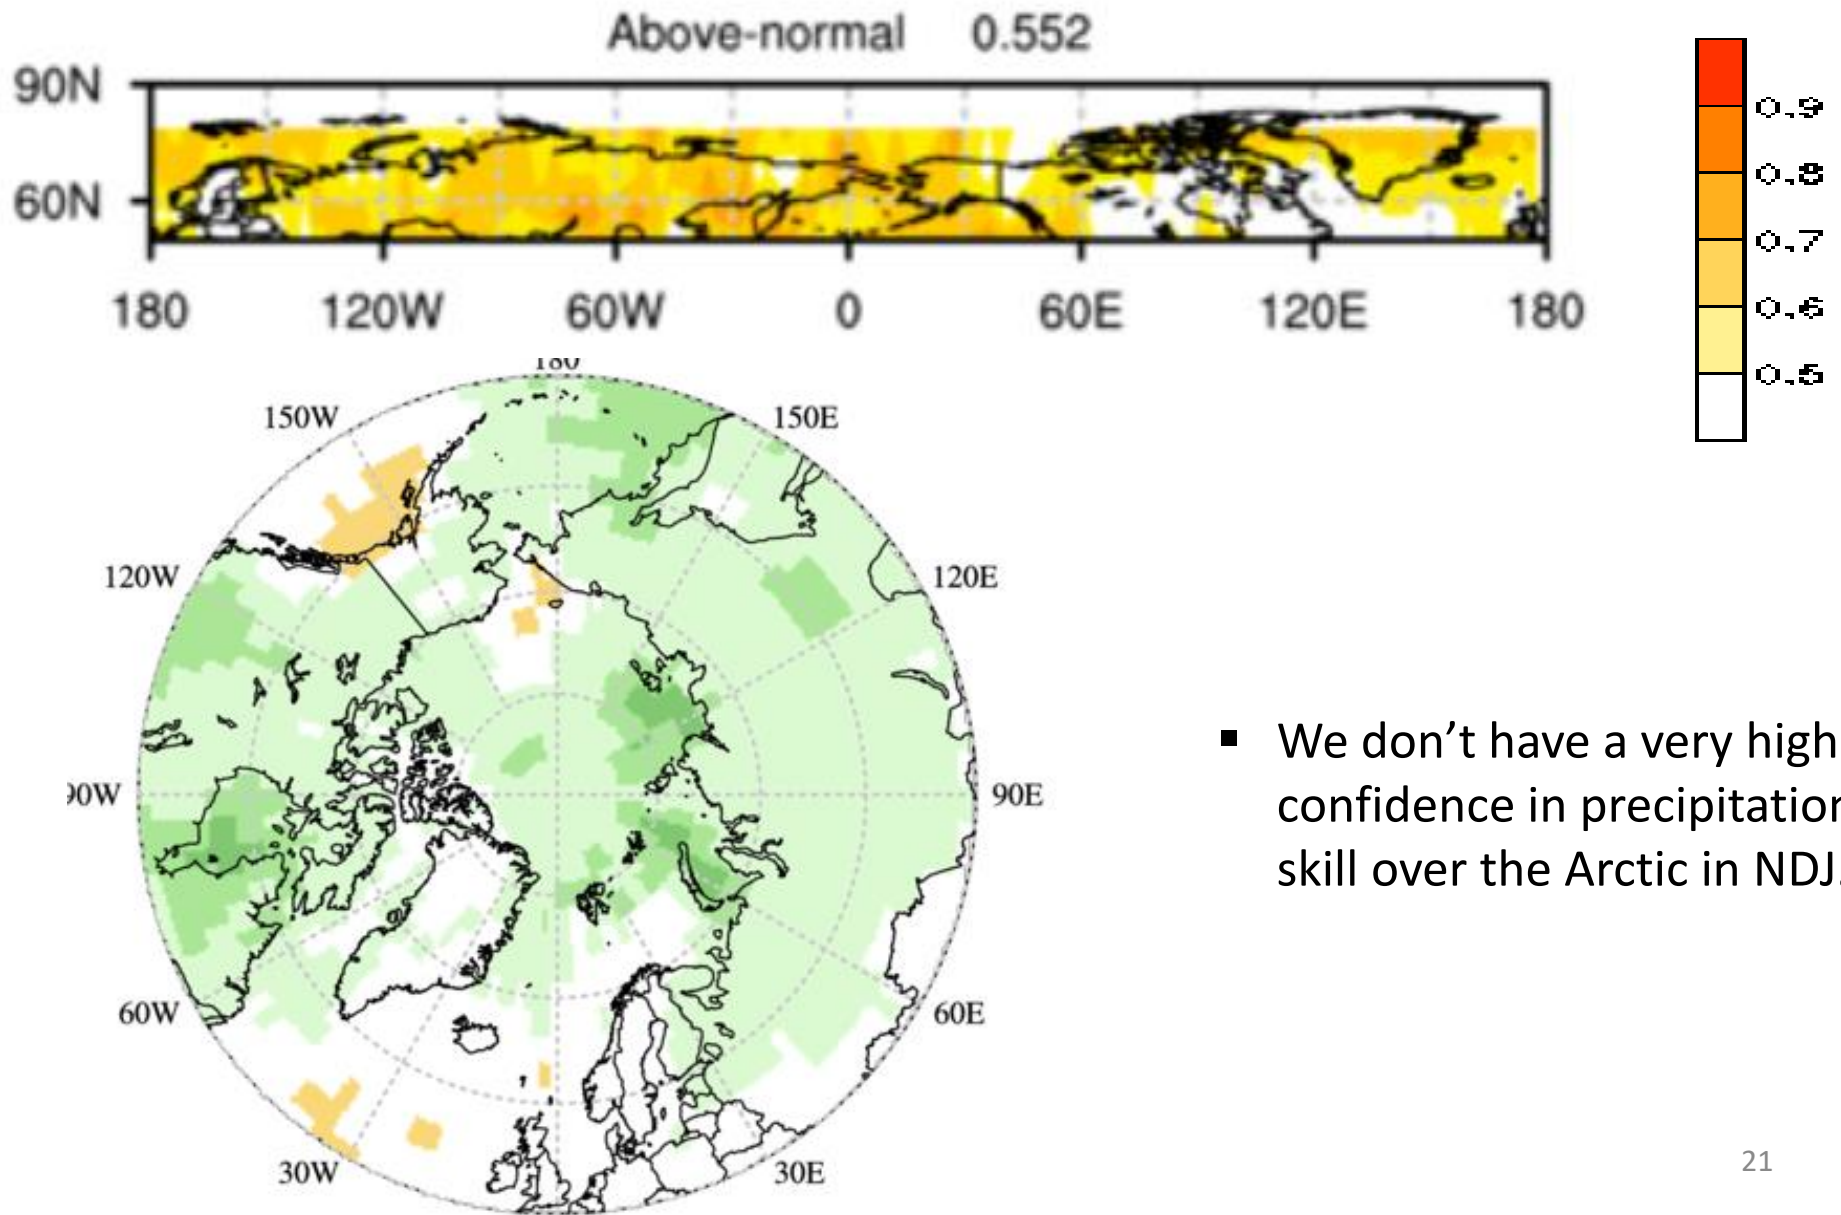

Discussing historical skill over the Arctic, Temperature (confidence with respect to the historical skill)

- If a historical skill was good over a certain region (e.g. colored region on the upper figure) we are more confident about the forecast results over the same region
- Overall confidence is weak in NDJ over the Arctic.

Discussing historical skill over the Arctic, Precipitation (confidence with respect to the historical skill)

Discussing historical skill over the Arctic, SWE (confidence with respect to the historical skill)

Calibrated CanSIPS lead 1 forecast: SWE NDJ2021

- If a historical skill was good over a certain region (e.g. colored region on the upper figure) we are more confident about the forecast results over the same region

Conclusions

- ❑ We use Multi Model Ensemble (MME) approach to calculate seasonal forecast.
- ❑ We use probabilistic approach to communicate seasonal forecast results.
- ❑ For evaluation over the Arctic we use a combination of observations and model results called re-analysis.
- ❑ JJA2021 MME temperature forecast over the Arctic region was ~50% correct, which is generally good result and much higher than a pure chance (i.e. 33%).
- ❑ We expect above normal temperatures and sea-surface temperatures over majority of the Arctic regions in NDJ21/22.
- ❑ Above normal SWE is expected over Alaska W Canada and northern and western Chukchi and Bering regions while below normal snow is forecast for western Nordic and east Siberian regions.
- ❑ We expect above normal precipitation over several most Arctic regions with an exception of Nordic regions where equal probability chances are mostly forecast.

Thank you!
